1.2 Description

The ESP32-PICO-V3 is a System-in-Package (SiP) device that is based on ESP32 with ECO V3 wafer, providing complete Wi-Fi and Bluetooth® functionalities. It integrates a 4 MB SPI flash.

At the core of ESP32-PICO-V3 is the ESP32 (ECO V3) chip, which is a single 2.4 GHz Wi-Fi and Bluetooth combo chip designed with TSMC's 40 nm low-power technology. ESP32-PICO-V3 integrates all peripheral components seamlessly, including a crystal oscillator, flash, filter capacitors and RF matching links in one single package. Module assembly and testing are already done at SiP level. As such, ESP32-PICO-V3 reduces the complexity of supply chain and improves control efficiency.

With its ultra-small size, robust performance and low-energy consumption, ESP32-PICO-V3 is well suited for any space-limited or battery-operated applications, such as wearable electronics, medical equipment, sensors and other IoT products.

Comparing to other ESP32 series chips, ESP32-PICO-V3 has an additional pin GPIO20. For chip security purpose, flash pins DI, DO, /HOLD, /WP are not led out.

Notice:

1. Note that the embedded flash is connected to VDD_SDIO which is driven directly by VDD3P3_RTC through a 6 Ω resistor. Due to this resistor, there is some voltage drop on this pin from VDD3P3_RTC.
2. Pins CMD/IO11 and CLK/IO6 are used for connecting the embedded flash, and are not recommended for other uses. For details, please see Section 5 Schematics.
3. IO6/IO7/IO8/IO9/IO10/IO11/IO20 belong to VDD_SDIO power domain and cannot work when VDD_SDIO power shuts down.
4. For peripheral pin configurations, please refer to *ESP32 Datasheet*.

3.3 Compatibility with ESP32-PICO-D4

ESP32-PICO-V3 is a new product but it is very similar to ESP32-PICO-D4. It may be possible to update an ESP32-PICO-D4 hardware design to use ESP32-PICO-V3 with minimal or no hardware changes, but please pay attention to the following:

- Usage of six pins has changed:

Table 2: Usage of Pins on ESP32-PICO-V3 and ESP32-PICO-D4

Pin No.	ESP32-PICO-V3	ESP32-PICO-D4
25	Not connected	GPIO16, used by embedded flash
27	GPIO20, can be used	GPIO17, used by embedded flash
32	SD0 (GPIO7), can be used	SD0 (GPIO7), used by embedded flash
33	SD1 (GPIO8), can be used	SD1 (GPIO8), used by embedded flash
35	Not connected	GPIO18, can be used
36	Not connected	GPIO23, can be used

- None of the embedded flash data pins are connected externally on ESP32-PICO-V3. These are connected internally to GPIO16, GPIO17, GPIO18, and GPIO23.
- It is not possible to connect an external PSRAM chip to ESP32-PICO-V3.
- If a 32.768 kHz crystal is connected to ESP32-PICO-D4 then please refer to *ESP32 ECO V3 User Guide* for

information about necessary hardware changes for ESP32-PICO-V3.

- Refer to *ESP32 ECO V3 User Guide* for information about possible software changes and optimizations for ESP32 ECO V3.
- EMC compliance and RF performance tests should be repeated after a design is updated to use ESP32-PICO-V3.
- Refer to *ESP32-PICO-D4 Datasheet* for more information about ESP32-PICO-D4.

3.4 Strapping Pins

ESP32 has five strapping pins: MTDI, GPIO0, GPIO2, MTDO, GPIO5. The pin-pin mapping between ESP32 and the SiP is as follows, which can be seen in Chapter 5 *Schematics*:

- MTDI = IO12
- GPIO0 = IO0
- GPIO2 = IO2
- MTDO = IO15
- GPIO5 = IO5

Software can read the values of these five bits from register "GPIO_STRAPPING".

During the chip's system reset release (power-on-reset, RTC watchdog reset and brownout reset), the latches of the strapping pins sample the voltage level as strapping bits of "0" or "1", and hold these bits until the chip is powered down or shut down. The strapping bits configure the device's boot mode, the operating voltage of VDD_SDIO and other initial system settings.

Each strapping pin is connected to its internal pull-up/pull-down during the chip reset. Consequently, if a strapping pin is unconnected or the connected external circuit is high-impedance, the internal weak pull-up/pull-down will determine the default input level of the strapping pins.

To change the strapping bit values, users can apply the external pull-down/pull-up resistances, or use the host MCU's GPIOs to control the voltage level of these pins when powering on ESP32.

After reset release, the strapping pins work as normal-function pins.

Refer to Table 3 for a detailed boot-mode configuration by strapping pins.

Table 3: Strapping Pins

Voltage of Internal LDO (VDD_SDIO)			
Pin	Default	3.3 V	1.8 V
MTDI	Pull-down	0	1
Booting Mode			
Pin	Default	SPI Boot	Download Boot
GPIO0	Pull-up	1	0
GPIO2	Pull-down	Don't-care	0
Enabling/Disabling Debugging Log Print over U0TXD During Booting			
Pin	Default	U0TXD Active	U0TXD Silent
MTDO	Pull-up	1	0
Timing of SDIO Slave			

Pin	Default	FE Sampling FE Output	FE Sampling RE Output	RE Sampling FE Output	RE Sampling RE Output
MTDO	Pull-up	0	0	1	1
GPIO5	Pull-up	0	1	0	1

Note:

- FE: falling-edge, RE: rising-edge.
- Firmware can configure register bits to change the settings of ”Voltage of Internal LDO (VDD_SDIO)” and ”Timing of SDIO Slave”, after booting.
- The operating voltage of ESP32-PICO-V3’s integrated external SPI flash is 3.3 V. Therefore, the strapping pin MTDI should hold bit ”0” during the SiP power-on reset.

2. For VDD3P3_CPU and VDD3P3_RTC power domain, per-pin current sourced in the same domain is gradually reduced from around 40 mA to around 29 mA, V_{OH}>=2.64 V, as the number of current-source pins increases.
3. Pins occupied by flash and/or PSRAM in the VDD_SDIO power domain were excluded from the test.

4.4 Current Consumption Characteristics

With the use of advanced power-management technologies, ESP32 can switch between different power modes.

For details on different power modes, please refer to Section *RTC and Low-Power Management* in *ESP32 Datasheet*.

Table 7: Current Consumption Depending on RF Modes

Work mode	Description		Average (mA)	Peak (mA)
Active (RF working)	TX	802.11b, 20 MHz, 1 Mbps, @19.5 dBm	233	368
		802.11g, 20 MHz, 54 Mbps, @14 dBm	181	258
		802.11n, 20 MHz, MCS7, @13 dBm	178	248
		802.11n, 40 MHz, MCS7, @13 dBm	162	205
	RX	802.11b/g/n, 20 MHz	110	111
		802.11n, 40 MHz	116	117

Note:

- The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitter measurements are based on a 100% duty cycle.
- The current consumption figures for in RX mode are for cases when the peripherals are disabled and the CPU idle.

Table 8: Current Consumption Depending on Work Modes

Work mode	Description		Current consumption (Typ)
Modem-sleep	The CPU is powered on	240 MHz	30 ~ 68 mA
		160 MHz	27 ~ 44 mA
		Normal speed: 80 MHz	20 ~ 31 mA
Light-sleep	—		0.8 mA
Deep-sleep	The ULP co-processor is powered on.		150 μA
	ULP sensor-monitored pattern		100 μA @1% duty
	RTC timer + RTC memory		10 μA
	RTC timer only		5 μA
Power off	CHIP_PU is set to low level, the chip is powered off.		1 μA

Note:

- The current consumption figures in Modem-sleep mode are for cases where the CPU is powered on and the cache idle.
- When Wi-Fi is enabled, the chip switches between Active and Modem-sleep modes. Therefore, current consumption changes accordingly.
- In Modem-sleep mode, the CPU frequency changes automatically. The frequency depends on the CPU load and the peripherals used.
- During Deep-sleep, when the ULP co-processor is powered on, peripherals such as GPIO and I²C are able to operate.
- The "ULP sensor-monitored pattern" refers to the mode where the ULP coprocessor or the sensor works periodically. When ADC works with a duty cycle of 1%, the typical current consumption is 100 μA.

5 Schematics

This is the reference design of the module.

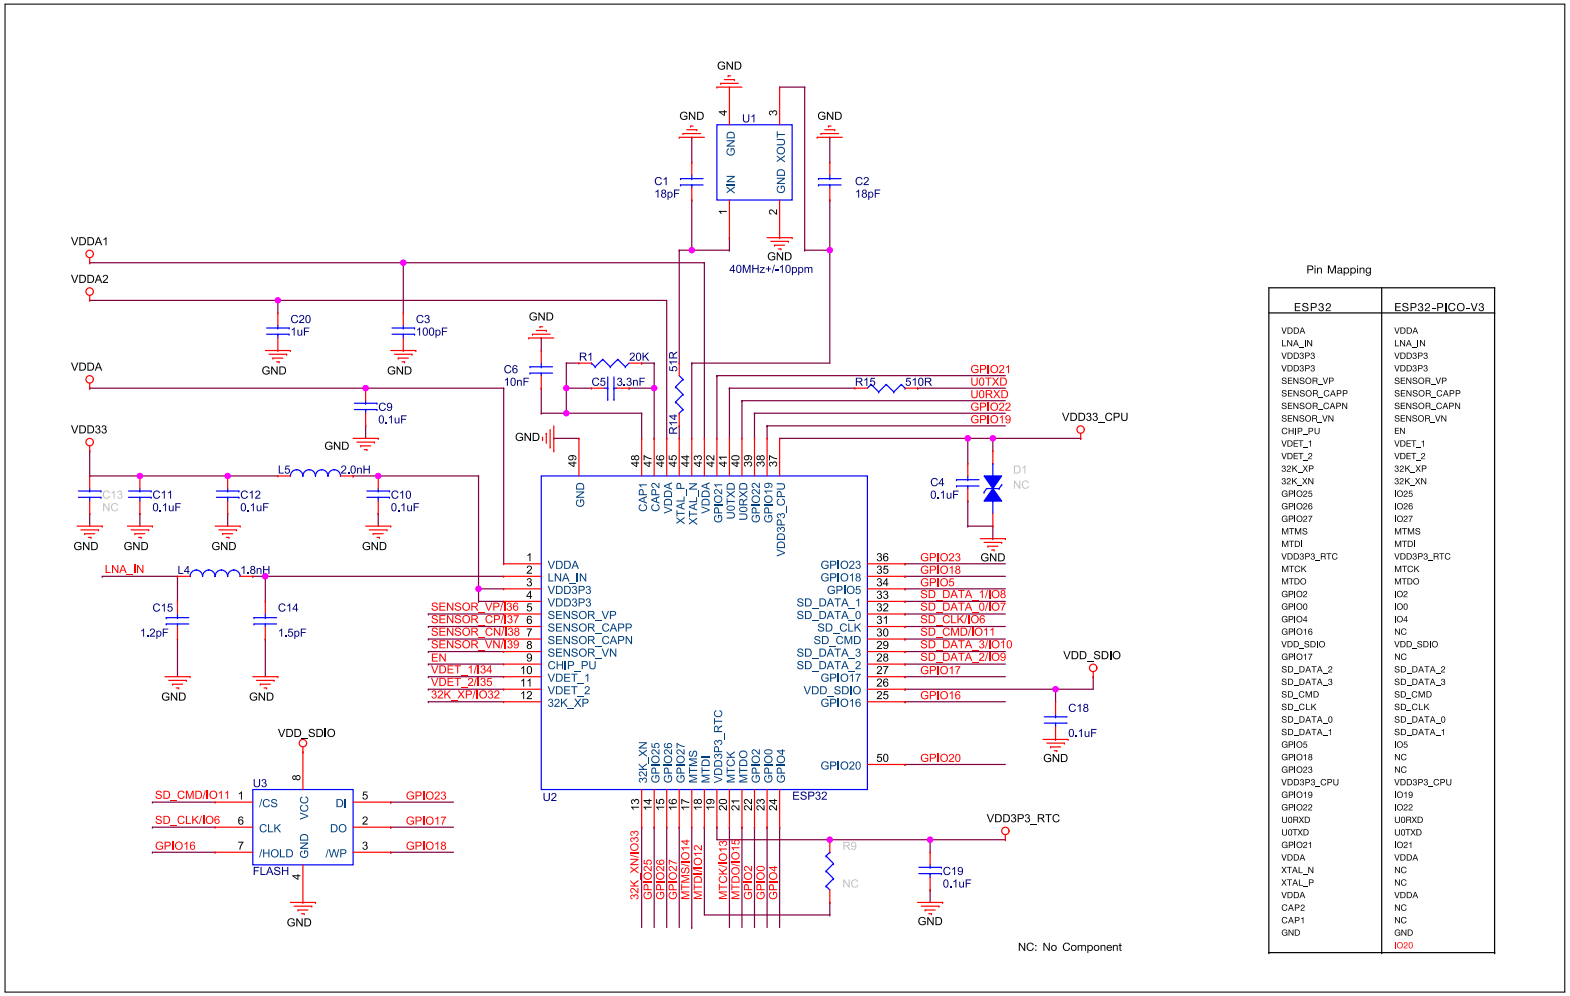

Figure 3: ESP32-PICO-V3 Schematics

6 Peripheral Schematics

This is the typical application circuit of the module connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

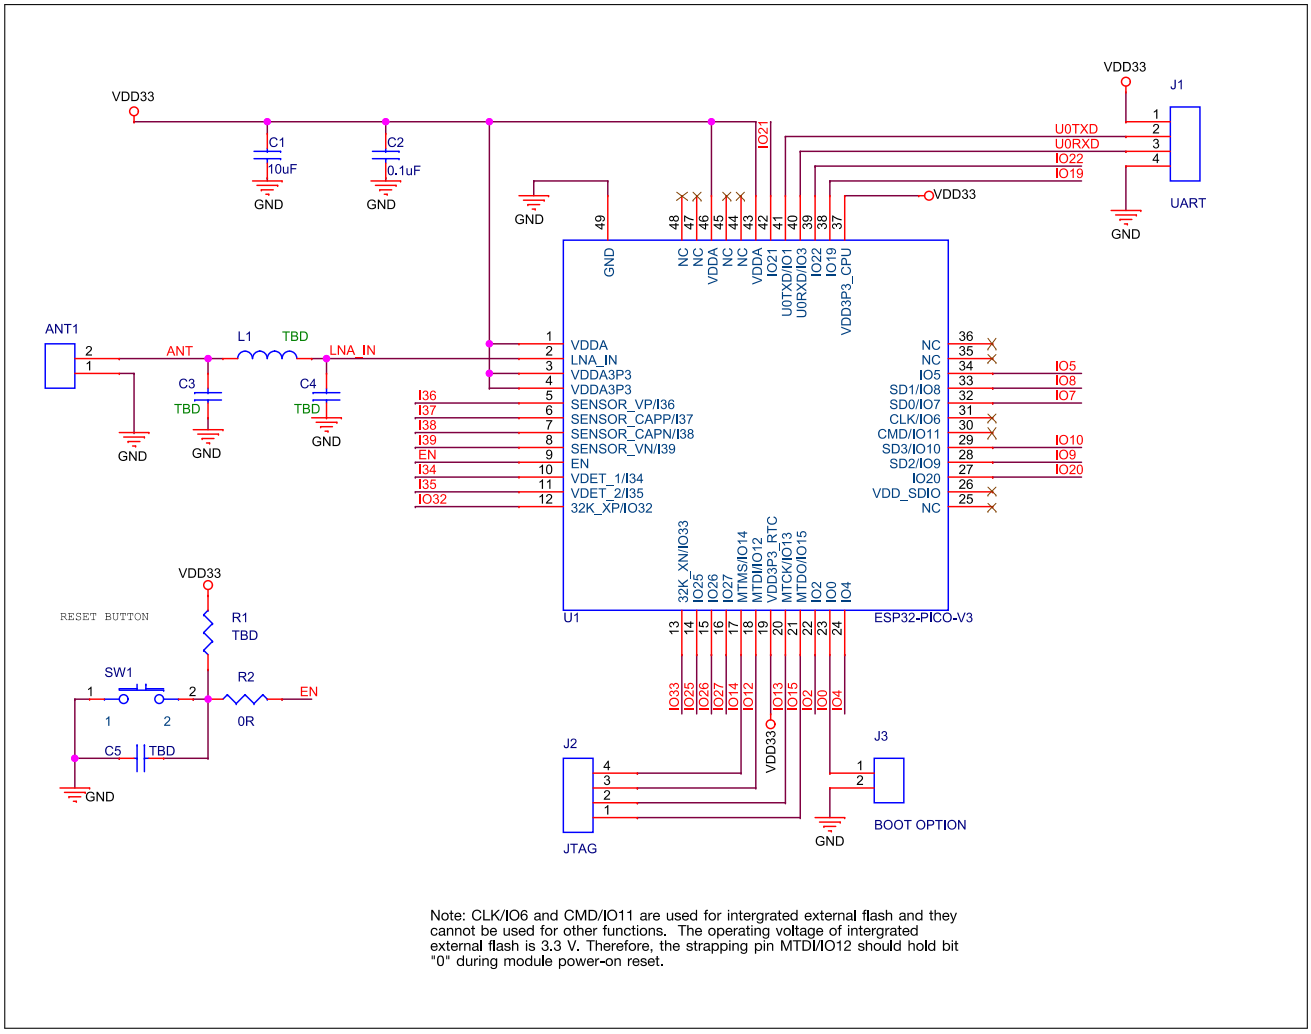

Figure 4: ESP32-PICO-V3 Peripheral Schematics

Note:

To ensure the power supply to the ESP32 chip during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually R = 10 kΩ and C = 1 μF. However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32's power-up and reset sequence timing diagram, please refer to Section *Power Scheme* in *ESP32 Datasheet*.

8 Product Handling

8.1 Storage Condition

The products sealed in Moisture Barrier Bag (MBB) should be stored in a noncondensing atmospheric environment of < 40 °C/90% RH.

The module is rated at moisture sensitivity level (MSL) 3.

After unpacking, the module must be soldered within 168 hours with factory conditions 25±5 °C and 60% RH. The module needs to be baked if the above conditions are not met.

8.2 ESD

- Human body model (HBM): 2000 V
- Charged-device model (CDM): 500 V
- Air discharge: 6000 V
- Contact discharge: 4000 V

8.3 Reflow Profile

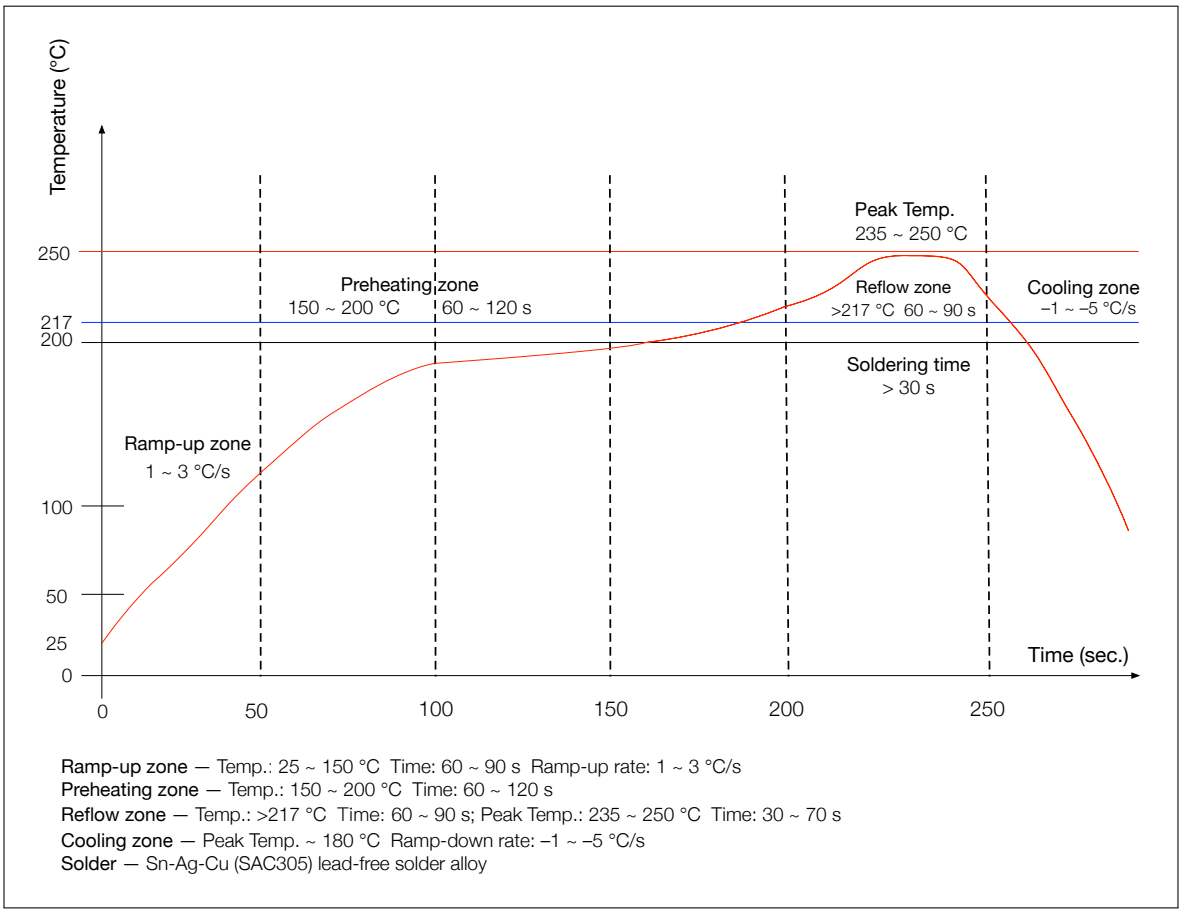

Figure 8: Reflow Profile

Note:
Solder the module in a single reflow.

9 MAC Addresses and eFuse

The eFuse in ESP32 has been burnt into 48-bit mac_address. The actual addresses the chip uses in station, AP, BLE, and Ethernet modes correspond to mac_address in the following way:

- Station mode: mac_address
- AP mode: mac_address + 1
- BLE mode: mac_address + 2
- Ethernet mode: mac_address + 3

In the 1 Kbit eFuse, 256 bits are used for the system (MAC address and chip configuration) and the remaining 768 bits are reserved for customer applications, including flash-encryption and chip-ID.
